

Materials and Energy Balance

Heat Balance in Pyrometallurgical Processes

Procedure in Calculating a Heat Balance

1. Work out the complete stoichiometry of the reactions and materials balance
2. Denote the temperatures at which all materials enter and leave the system
3. Fix and specify the basis of the heat balance (quantity throughout the process), reference temperature and reference state for water and other substances
4. Calculate the sensible heat for each input and output material
5. Calculate heats of reaction for the quantities of all the chemical reactions
6. Calculate if present, heats required to bring input materials up to the reference states
7. Calculate if present, heat supplied electrically or by other means from the surroundings
8. List and add input and output items, finding heat loss by the difference

Heat Balance in Roasting

Oxidation reactions occurring during roasting processes to convert metal sulphides to oxides are highly exothermic

Fuel is seldomly used and the sulphide ores that enter the furnace convert to oxides and flue gases which take the liberated heat as their sensible heat

Products are raised from 298 to an elevated temperature which can be calculated by making the heat balance

$$\text{Heat Input} = \text{Heat Output} = (H_T - H_{298})_{\text{products}}$$

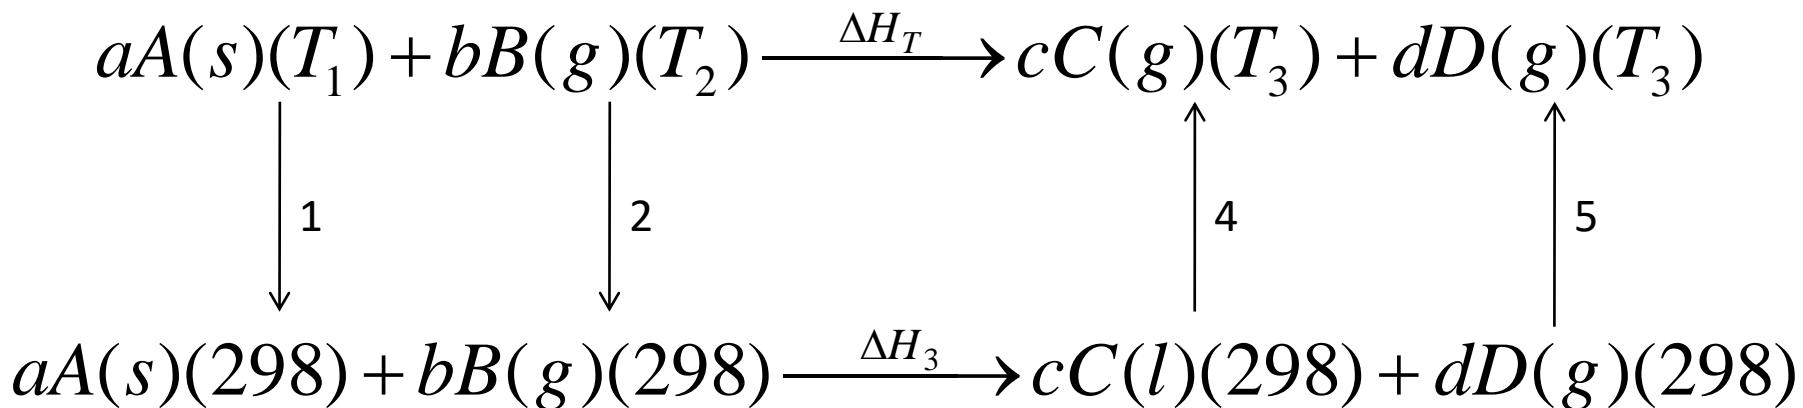

Since there is no fuel in the roasting process, the final temperature of the products can not be controlled by arrangement of the amount of combusting material

The temperature attained by the products is calculated in a similar way to the calculation of flame temperature

Flame temperature

The maximum temperature the gaseous products can reach upon proceeding of an exothermic reaction is called the flame temperature

The furnace is considered as adiabatic for no heat loss to the surroundings and maximum flame temperature

$$\Delta H_1 + \Delta H_2 + \Delta H_3 = -\Delta H_4 - \Delta H_5$$

$$\Delta H_4 = c \left[\int_{298}^{T_m(C)} C_{P(C(l))} dT + \Delta H_{v(C)} + a \int_{T_m(C)}^{T_{flame}} C_{P(C(g))} dT \right] = c(H_{T_{flame}} - H_{298})_{C(g)}$$

$$\Delta H_5 = d \int_{298}^{T_{flame}} C_{P(D(g))} dT = d(H_{T_{flame}} - H_{298})_{D(g)}$$

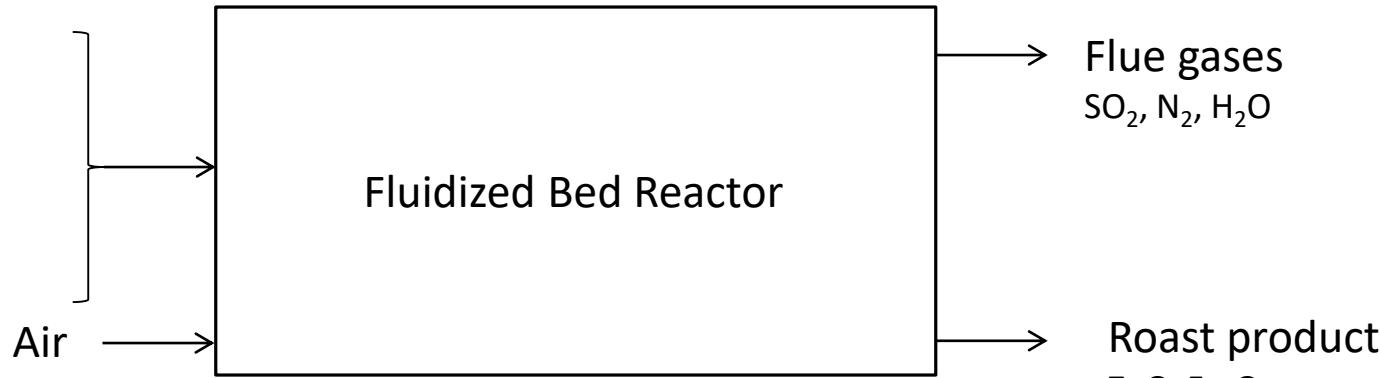

Roasting furnace analysis

Zinc concentrate of the following composition is roasted in a fluidized bed reactor with stoichiometric amount of air. During roasting 80% of total iron charged forms $\text{ZnO} \cdot \text{Fe}_2\text{O}_3$. Find the bed temperature when 10% heat input is lost to the surroundings.

Rational Analysis wt%					
Material	ZnS	FeS_2	PbS	SiO_2	H_2O
Zinc concentrate	75	18	3	3	1

Basis 1000 kg of zinc concentrate

75% ZnS
18% FeS_2
3% PbS
3% SiO_2
1% H_2O

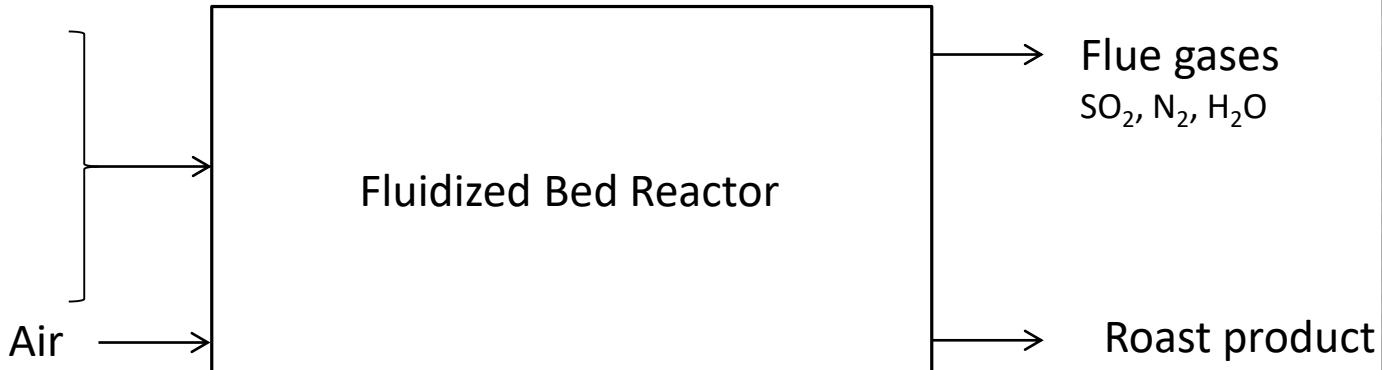

Reactions

Basis 1000 kg of zinc concentrate @298 K

$$\text{Fe}_2\text{O}_3 \quad 0.204 * H_T - H_{298} = 0.204 * (31.75T + 0.88 * 10^{-3}T^2 - 8446)$$

$$\text{ZnO.Fe}_2\text{O}_3 \quad 0.818 * H_T - H_{298} = 0.818 * (27.78T + 8.86 * 10^{-3}T^2 - 9044)$$

$$\text{PbSO}_4 \quad 0.126 * H_T - H_{298} = 0.126 * (10.96T + 15.5 * 10^{-3}T^2 - 4.20 * 10^5 / T - 3327)$$

$$\text{SiO}_2 \quad 0.5 * H_T - H_{298} = 0.5 * (14.41T + 0.97 * 10^{-3}T^2 - 4455)$$

$$\text{H}_2\text{O} \quad 0.555 * H_T - H_{373} = 0.555 * (7.30T + 1.23 * 10^{-3}T^2 - 2286) + 0.555 * \Delta H_m = 0.555 * (11170)$$

$$\text{SO}_2 \quad 11.822 * H_T - H_{298} = 11.822 * (11.04T + 0.94 * 10^{-3}T^2 + 1.84 * 10^5 / T - 3992)$$

$$\text{N}_2 \quad 65.698 * H_T - H_{298} = 65.698 * (6.83T + 0.45 * 10^{-3}T^2 + 0.12 * 10^5 / T - 2117)$$

$$\text{Total Heat Output} = 623.13T + 49.83 * 10^{-3}T^2 - 197018$$

$$\text{Heat available for raising the temperature of the products} = -1025044 \text{ kcal}$$

$$623.13T + 49.83 * 10^{-3}T^2 - 197018 = -1025044$$

$$49.83 * 10^{-3}T^2 + 623.13T - 1222062 = 0$$

$$T = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$a = 49.83 * 10^{-3}, b = 623.13, c = -1222062$$

$$\underline{T = 1723.6 \text{ K}}$$

The rate of roasting reactions are low due to the solid state of the sulphide concentrates
Extra oxygen is supplied by the excess air which considerably increases the rate of oxidation
Consider the same process with the use of 20% excess air

The flue gas content

$$\text{SO}_2 \quad 11.822 \text{ kg-moles}$$

$$\text{N}_2 \quad 65.698 \text{ kg-moles} + 65.698 * 0.2 = 78.84 \text{ kg-moles}$$

$$\text{O}_2 \quad 65.698 * 0.2 / 0.79 * 0.21 = 3.49 \text{ kg-moles}$$

$$\text{H}_2\text{O} \quad 0.555 \text{ kg-moles}$$

Increase in the total heat output

$$65.698 * 0.2 * H_T - H_{298}(\text{N}_2) + 3.49 * H_T - H_{298}(\text{O}_2) = 118.73T + 14.12 * 10^{-3}T^2 - 34730$$

$$\text{Total heat output} = 723.76T + 56.55 * 10^{-3}T^2 - 228495$$

$$\text{Available heat} = -1025044 \text{ kcal}$$

$$56.55 * 10^{-3}T^2 + 723.76T - 1253539 = 0$$

$$\underline{T = 1545 \text{ K}}$$

If 40% excess air was used to increase the oxidation rate,

Increase in the total heat output

$$65.698 * 0.4 * H_T - H_{298}(\text{N}_2) + 6.98 * H_T - H_{298}(\text{O}_2) = 2 * (118.73T + 14.12 * 10^{-3}T^2 - 34730)$$

$$\text{So, } 63.36 * 10^{-3}T^2 + 824.32T - 1284995 = 0$$

$$\underline{T = 1407 \text{ K}}$$

Materials for the construction of the furnace may change due only to use of excess air

Heat Balance in Ironmaking

Consider an iron blast furnace charged with iron ore, limestone and coke for 20-day period to produce 507 tons pig iron per day

Rational Analysis wt%								
Material	Fe ₂ O ₃	SiO ₂	MnO	Al ₂ O ₃	H ₂ O	C	CaO	CO ₂
Limestone							56.25	43.75
Coke					4.8	95.2		

Air is blown through tuyeres at 704 C, the charge, flux and coke are at 25 C, gases leave at 149 C

Moisture of 292 kg in one charge per ton of pig iron is added

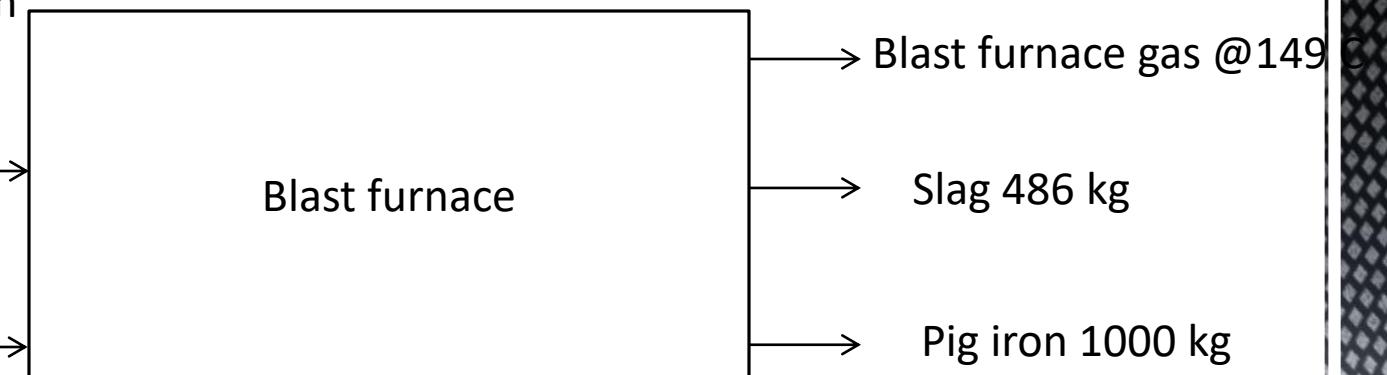

The ultimate analysis of the pig iron gives 93% Fe, 3.9% C, 1.1% Si, 1.8% Mn, 0.22%P

The rational analysis of flue gases on dry basis gives 60% N₂, 21.3% CO, 16.5% CO₂, 2.2% H₂

Basis 1000 kg of pig iron

Ore
Limestone 410 kg
Coke 764 kg

Air @ 704 C

Basis 1000 kg of pig iron

Ore

292 kg H₂O

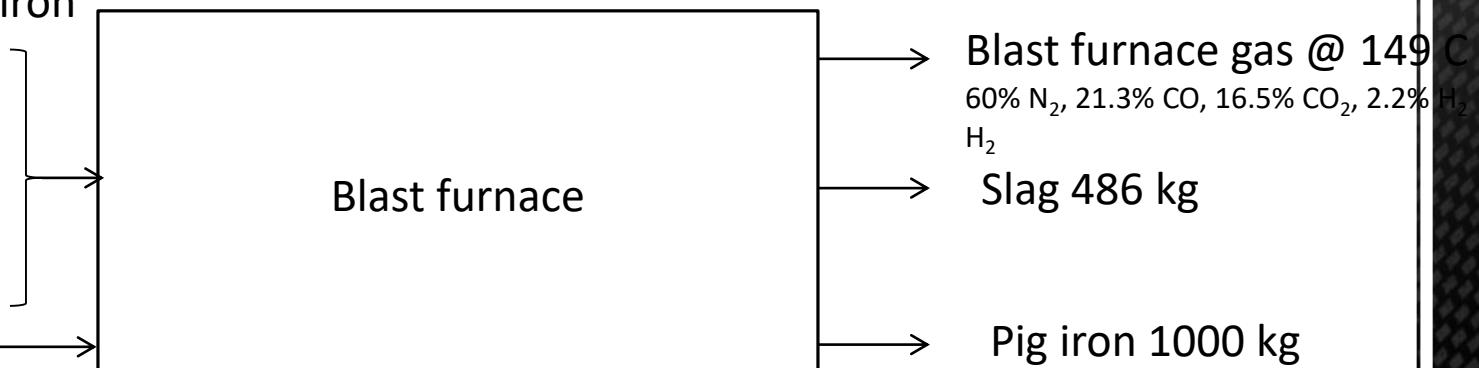

Limestone 410 kg

43.75% CO₂

Coke 764 kg

95.2% C, 4.8% H₂O

Air @ 704 C

Reactions

Material Balance

C balance is solved to find the quantity of top gases

$$\text{C in coke} + \text{C in limestone} = \text{C in pig iron} + \text{C in top gas}$$

$$\text{Dry weight of C in coke} = 764 * 95.2 / 100 = 727.33 \text{ kg}$$

$$\text{C in limestone} = 410 * 43.75 / 100 * 12 / 44 = 48.92 \text{ kg}$$

$$\text{C in pig iron} = 1000 * 3.9 / 100 = 39 \text{ kg}$$

$$\text{C in top gas} = 727.33 + 48.92 - 39 = 733.58 \text{ kg} = 64.8 \text{ kg-atom}$$

$$C \text{ in top gas} = 723.66 + 48.92 - 39 = 733.58 \text{ kg} = 64.8 \text{ kg-atom}$$

The top gas contains 16.5 CO₂ and 21.3% CO on dry basis

$$\text{Dry top gas contains in total} = 64.8 / (0.165 + 0.213) = 171.43 \text{ kg-moles}$$

Therefore on a dry basis the top gas contains:

$$CO_2 = 171.43 * 16.5 / 100 = 28.29 \text{ kg-moles}$$

$$CO = 171.43 * 21.3 / 100 = 36.51 \text{ kg-moles}$$

$$H_2 = 171.43 * 2.2 / 100 = 3.77 \text{ kg-moles}$$

$$N_2 = 171.43 * 59.9 / 100 = 102.69 \text{ kg-moles}$$

In addition the top gas contains H₂O from moisture in the charge and coke

$$H_2O = 292 / 18 + 764 * 4.8 / 100 = 16.22 + 36.67 = 52.89 \text{ kg-moles}$$

N₂ balance is solved to find the quantity of air blast

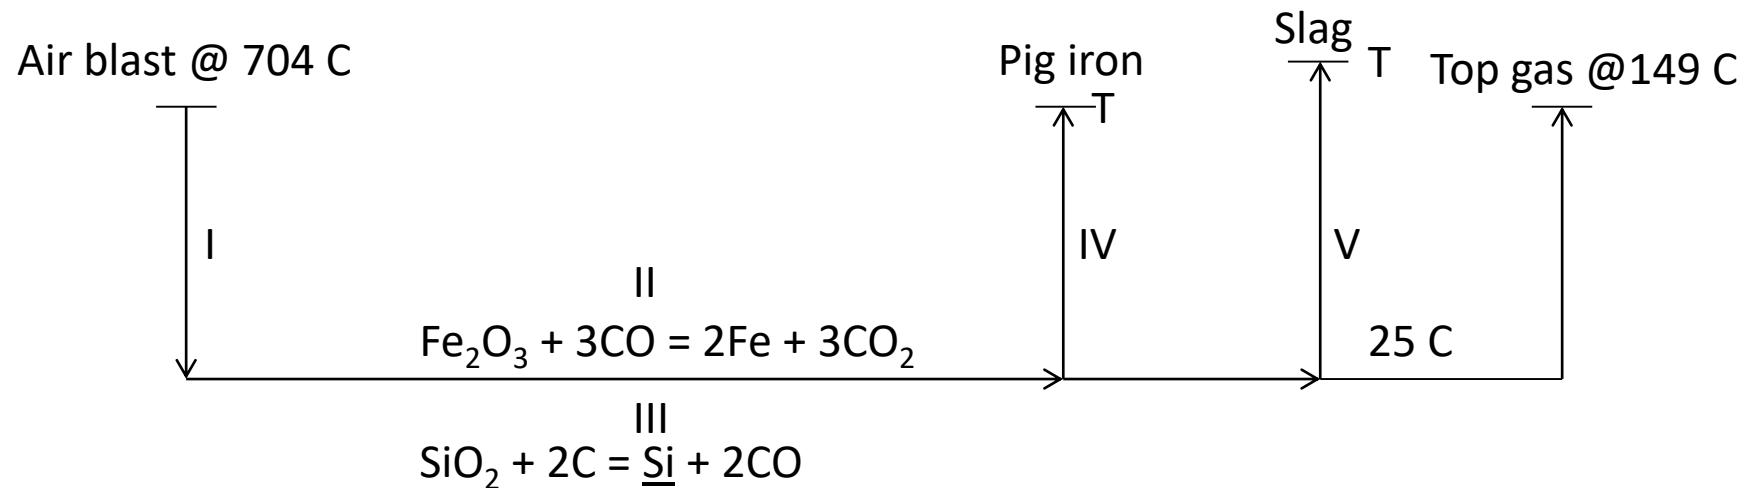

$$N_2 \text{ in air} = N_2 \text{ in top gas}$$

$$= 102.69 \text{ kg-atoms}$$

$$O_2 \text{ in air} = 102.69 * 21 / 79 = 27.3 \text{ kg-atoms}$$

$$\text{Total air blast} = 129.99 \text{ kg-atoms}$$

Heat balance diagram

I – Sensible heat in the air blast

II – Heat evolution by the exothermic reactions

III – Heat absorption by the endothermic reactions

IV – Sensible heat in pig iron

V – Sensible heat in slag

VI – Sensible heat in top gas

$$\text{I} + \text{II} = \text{III} + \text{IV} + \text{V} + \text{VI} + \text{heat loss}$$

Material and heat balances in the reactions

Exothermic Rxn, $\Delta H = -6300 \text{ kcal/kg-mole}$

Kg-atom Fe in pig iron = $2/3 \text{ kg-mole CO} = 2/3 \text{ kg-mole CO}_2$ produced Total heat evolved = $-6300 * 24.91 * 1/3 = -52311 \text{ kcal}$

$$\text{Kg-mole CO} = 3/2 * 100 * (92.99/100) / 56 = 24.91 \text{ kg-moles}$$

Endothermic Rxn, $\Delta H = 146200 \text{ kcal/kg-mole}$

$$\begin{aligned} \text{Kg-atom C} &= \text{kg-mole CO} = 2 * \text{kg-atom Si in pig iron} \\ &= 2 * 1000 * (1.1/100) / 28 = 0.79 \text{ kg-moles} \end{aligned}$$

Heat absorbed by reduction = $146200 * 0.79 / 2 = 57749 \text{ kcal}$

Endothermic Rxn, $\Delta H = 42500 \text{ kcal/kg-mole}$

$$\text{Kg-mole CO}_2 = \text{kg-mole CaCO}_3$$

Heat absorbed by decomposition = $42500 * 4.08 = 173400 \text{ kcal}$

$$= 410 * (43.75/100) / 44 = 4.08 \text{ kg-moles}$$

Endothermic Rxn, $\Delta H = 62400 \text{ kcal/kg-mole}$

$$\begin{aligned} \text{Kg-atom C} &= \text{kg-mole CO} = \text{kg-atom Mn in pig iron} \\ &= 1000 * (1.8/100) / 55 = 0.33 \text{ kg-moles} \end{aligned}$$

Heat absorbed by reduction = $62400 * 0.33 = 20592 \text{ kcal}$

Exothermic Rxn, $\Delta H = -29600 \text{ kcal/kg-mole}$

$$\begin{aligned} \text{Kg-atom C} &= \text{kg-mole CO produced} = 2 * \text{kg-mole O}_2 \text{ consumed} \\ &= 2 * 27.3 = 54.6 \text{ kg-moles} \end{aligned}$$

Total heat evolved = $-29600 * 54.6 = -1616160 \text{ kcal}$

Endothermic Rxn, $\Delta H = 212000 \text{ kcal/kg-mole}$

$$\begin{aligned} \text{Kg-atom C} &= \text{kg-mole CO} = 5/2 * \text{kg-atom P in pig iron} \\ &= 5/2 * 1000 * (2.1/100) / 31 = 0.17 \text{ kg-moles} \end{aligned}$$

Heat absorbed by reduction = $212000 * 0.17 / 5 = 7208 \text{ kcal}$

Endothermic Rxn, $\Delta H = 38000 \text{ kcal/kg-mole}$

$$\text{Kg-atom CO} = 2 * \text{kg-atom C} = 2 * \text{kg-atom CO}_2$$

Heat absorbed by conversion = $38000 * 3.5 = 133000 \text{ kcal}$

$$\text{Kg-atom C} = \text{kg-atom in coke} - \text{kg-atom in C in pig iron} - \text{kg-atom C consumed in all reactions}$$

$$= 727.33 / 12 - 1000 * (3.9 / 100) / 12 - (48.8 + 0.33 + 0.79 + 0.17 + 3.77) = 3.5 \text{ kg-atom}$$

3.5 kg-moles CO₂ consumed, 7 kg-moles CO produced

Kg-mole H_2O = kg-atom H_2 in the top gas
= 3.77 kg-moles

Endothermic Rxn, $\Delta H = 28200$ kcal/kg-mole

Heat absorbed by decomposition = $28200 * 3.77 = 106314$ kcal

Kg-mole H_2O = 52.89 kg-moles

Endothermic Rxn, $\Delta H_v = 9756$ kcal/kg-mole

Heat absorbed by evaporation = $9756 * 52.89 = 515995$ kcal

Total heat evolution by 2 exothermic reactions

-1668471 kcal

Total heat absorption by 7 endothermic reactions

1014258 kcal

There is excess heat of 654213 kcal that is available to take the products to a higher temperature

There is also heat evolution from the sensible heat in the air blast at 704 C:

Sensible heat = $-5235.3 * 27.3 = -142923.7 \text{ kcal}$

Sensible heat = $-4951.8 * 102.69 = -508500 \text{ kcal}$

Total heat input = Heat evolution from reactions + Sensible heat in the air blast

$$= -1668471 - 651424 \text{ kcal}$$

$$= \underline{-2319895 \text{ kcal}}$$

Sensible heat in the products:

Sensible heat in pig iron:

It is estimated that 1 kg of pig iron carries about 284 kcal of sensible heat from the furnace

$$H_T - H_{298} = 284 \text{ kcal/kg}$$

$$\text{Heat absorption} = 284 * 1000 = 284000 \text{ kcal}$$

Sensible heat in slag:

It is estimated that 1 kg of slag carries about 500 kcal of sensible heat from the furnace

$$H_T - H_{298} = 500 \text{ kcal/kg}$$

$$\text{Heat absorption} = 500 * 486 = 243000 \text{ kcal}$$

Sensible heat in top gas:

Top gas leaves the furnace at 149 C

$$CO_2 = 28.29 \text{ kg-moles}$$

$$H_{422} - H_{298} = 1181.6 \text{ kcal/kg-mole}$$

$$\text{Heat absorbed} = 1181.6 * 28.29 = 33427.5 \text{ kcal}$$

$$CO = 36.51 \text{ kg-moles}$$

$$H_{422} - H_{298} = 865.1 \text{ kcal/kg-mole}$$

$$\text{Heat absorbed} = 865.1 * 36.51 = 31584.8 \text{ kcal}$$

$$H_2 = 3.77 \text{ kg-moles}$$

$$H_{422} - H_{298} = 859.0 \text{ kcal/kg-mole}$$

$$\text{Heat absorbed} = 859.0 * 3.77 = 3238.4 \text{ kcal}$$

$$N_2 = 102.69 \text{ kg-moles}$$

$$H_{422} - H_{298} = 865.1 \text{ kcal/kg-mole}$$

$$\text{Heat absorbed} = 865.1 * 102.69 = 88837.1 \text{ kcal}$$

$$H_2O = 52.89 \text{ kg-moles}$$

$$H_{422} - H_{298} = 1007.6 \text{ kcal/kg-mole}$$

$$\text{Heat absorbed} = 1007.6 * 52.89 = 53292 \text{ kcal}$$

$$\text{Total sensible heat in top gas} = 210379.8 \text{ kcal}$$

Total sensible heat in the products = 737379.8 kcal

Total heat absorption from the reactions = 1014258 kcal

Total heat output = 1751638 kcal

Heat loss = Total heat input – Total heat output = 2319895 – 1751638 = 568257 kcal

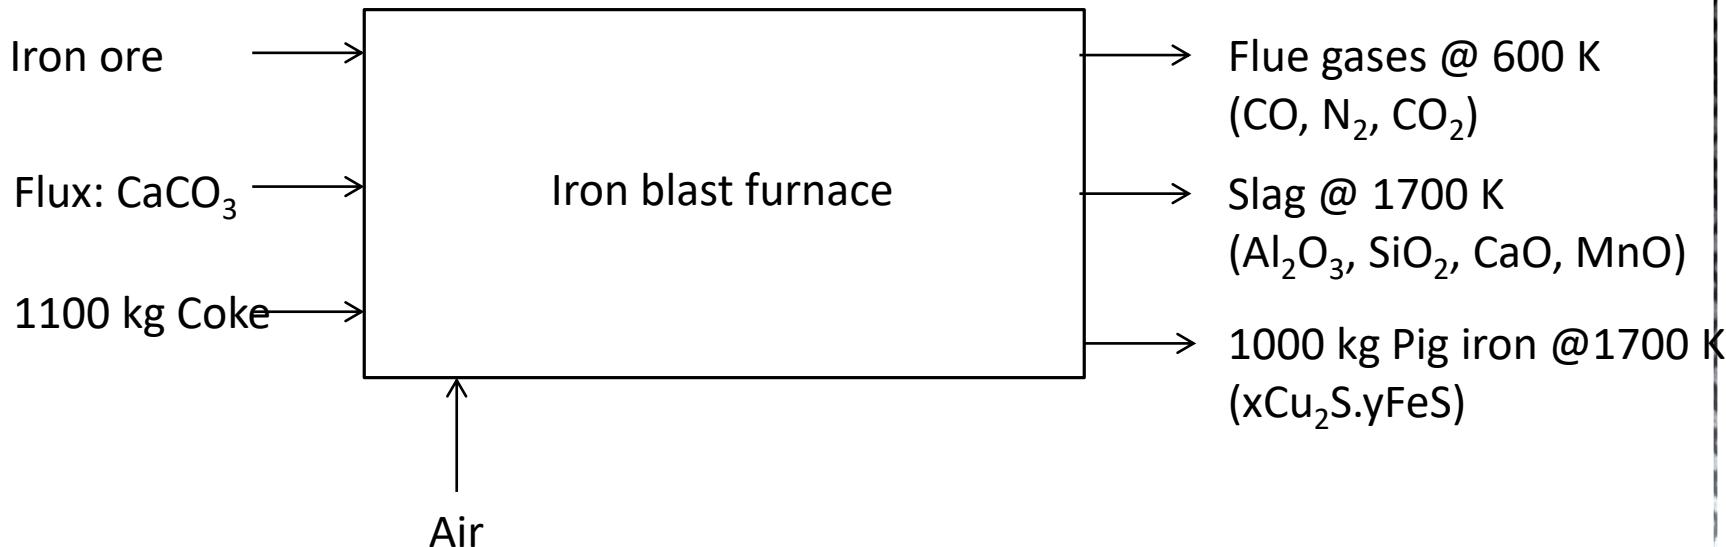

Thermal efficiency = (Total heat input – Heat loss)/ Total heat input) = 75.51%

Iron Smelting Analysis

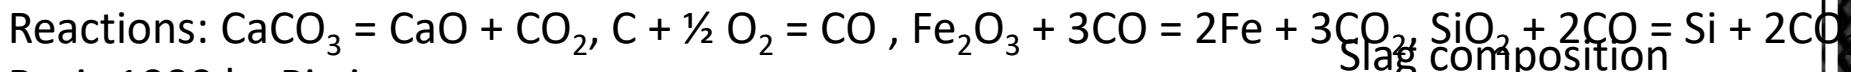

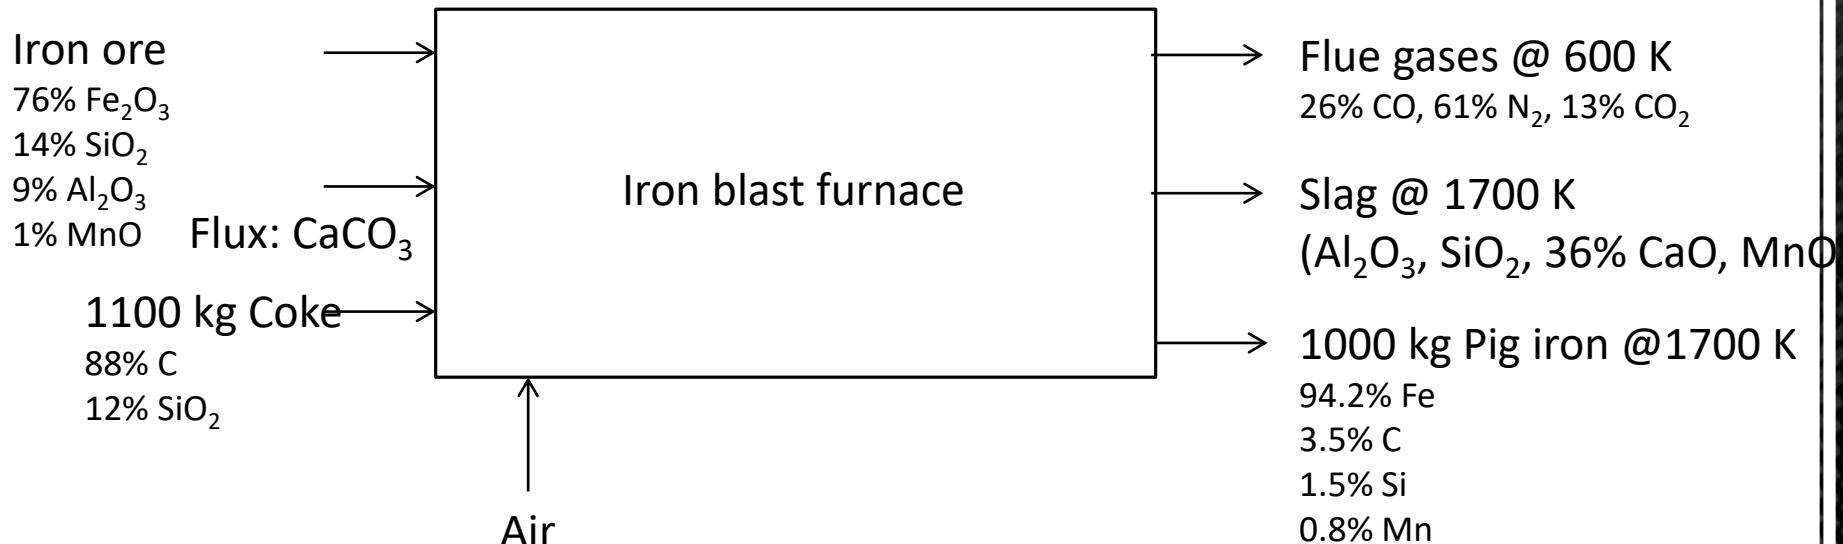

An iron blast furnace produces pig iron of composition 94.2% Fe, 3.5% C, 1.5% Si, 0.8% Mn. The burden of blast furnace consists of the following materials. Limestone is pure CaCO_3 and is converted to CaO that makes up 36% of the slag. The analysis of exit gas is given as 26% CO, 13% CO_2 and 61% N_2 ; assume no loss of iron in slag.

Rational Analysis wt%					
Material	Fe_2O_3	SiO_2	Al_2O_3	MnO	C
Iron ore	76	14	9	1	
Coke		12			88

Reactions: $\text{CaCO}_3 = \text{CaO} + \text{CO}_2$, $\text{C} + \frac{1}{2} \text{O}_2 = \text{CO}$, $\text{Fe}_2\text{O}_3 + 3\text{CO} = 2\text{Fe} + 3\text{CO}_2$,
 $\text{SiO}_2 + 2\text{CO} = \text{Si} + 2\text{CO}_2$

Iron Smelting Analysis

Basis 1000 kg Pig iron

Material balance

Fe in ore = Fe in pig iron

$$(76/100) * (112/160) * X = 1000 * (94.2/100) = 942 \text{ kg}$$

$$\text{Iron ore} = X = 1771 \text{ kg}$$

Si in slag = Si in ore + Si in coke - Si in pig iron

$$= 1771 * (14/100) * (28/60) + 1100 * (12/100) * (28/60) - 1000 * (1.5/100) = 162.31 \text{ kg}$$

$$\text{SiO}_2 \text{ in slag} = 162.31 * (60/28) = 347.81 \text{ kg}$$

Mn in slag = Mn in ore - Mn in pig iron

$$= 1771 * (1/100) * (55/71) - 1000 * (0.8/100) = 5.72 \text{ kg}$$

$$\text{MnO in slag} = 5.72 * (71/55) = 7.38 \text{ kg}$$

$$\text{Al}_2\text{O}_3 \text{ in slag} = \text{Al}_2\text{O}_3 \text{ in ore} = 1771 * (9/100) = 159 \text{ kg}$$

$$514.58 \text{ kg} = 64\%$$

$$\text{CaO amount} = 289.5 \text{ kg}$$

$$\text{Slag amount} = 804 \text{ kg}$$

Iron Smelting Analysis

Reactions: $\text{CaCO}_3 = \text{CaO} + \text{CO}_2$, $\text{C} + \frac{1}{2} \text{O}_2 = \text{CO}$, $\text{Fe}_2\text{O}_3 + 3\text{CO} = 2\text{Fe} + 3\text{CO}_2$, $\text{SiO}_2 + 2\text{CO} = \text{Si} + 2\text{CO}_2$

Basis 1000 kg Pig iron

Material balance

CaO in limestone = CaO in slag = 289.5 kg

CaCO₃ in limestone = $298.5 * (100/56) = 533 \text{ kg}$

C in flux + C in coke = C in pig iron + C in flue gases

C in flue gases = $533/100 + 1100 * (88/100)/12 - 1000 * (3.5/100)/12 = 83.1 \text{ kg-atoms}$

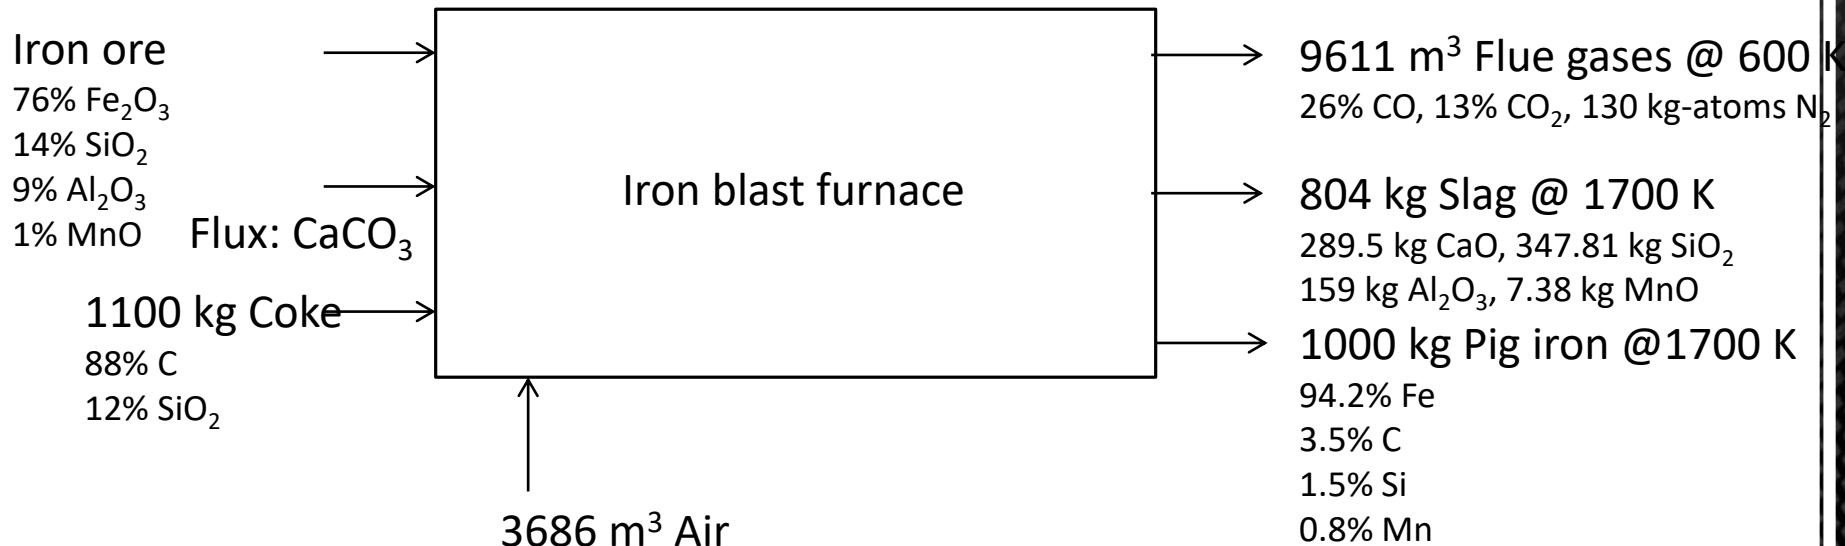

Total flue gas = $83.1 * (100/39) = 213.1 \text{ kg-moles} = 213.1 * 22.4 * (600/298) = 9611 \text{ m}^3$

N₂ in flue gases = $213.1 * (61/100) = 130 \text{ kg-atoms}$

N₂ in air = 130 kg-moles

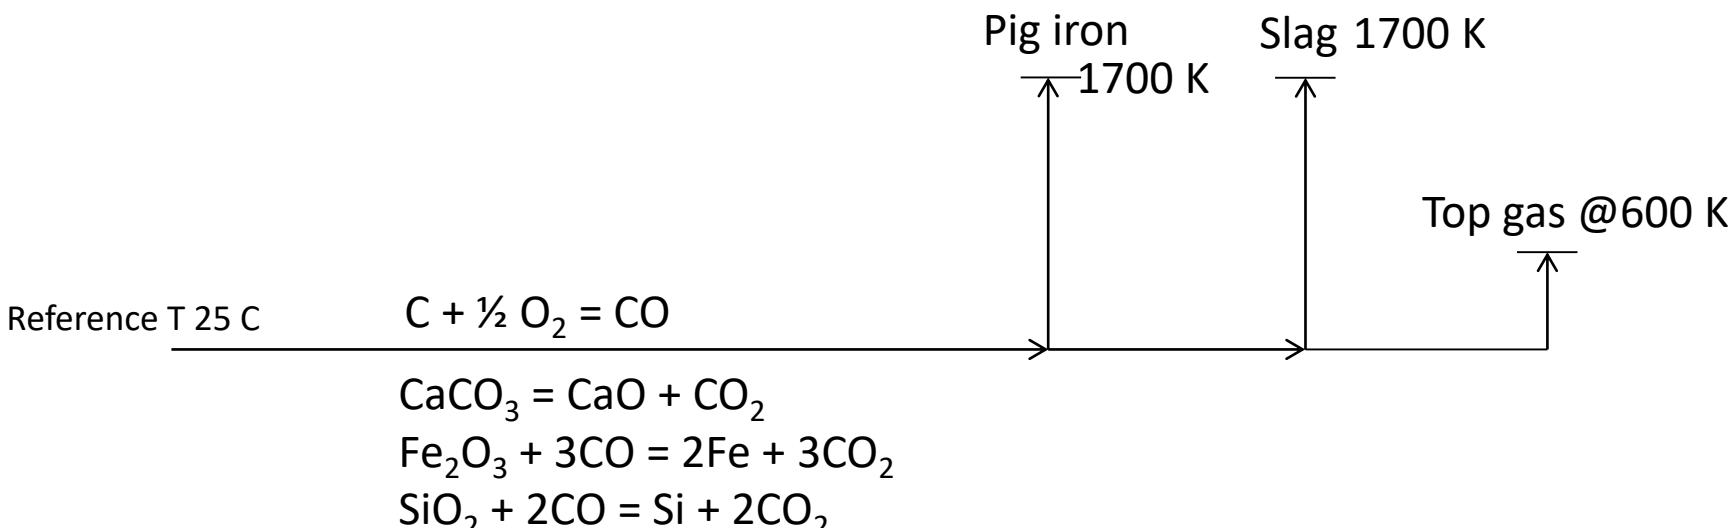

O₂ in air = $130 * (21/79) = 34.55 \text{ kg-moles}$

Iron Smelting Analysis

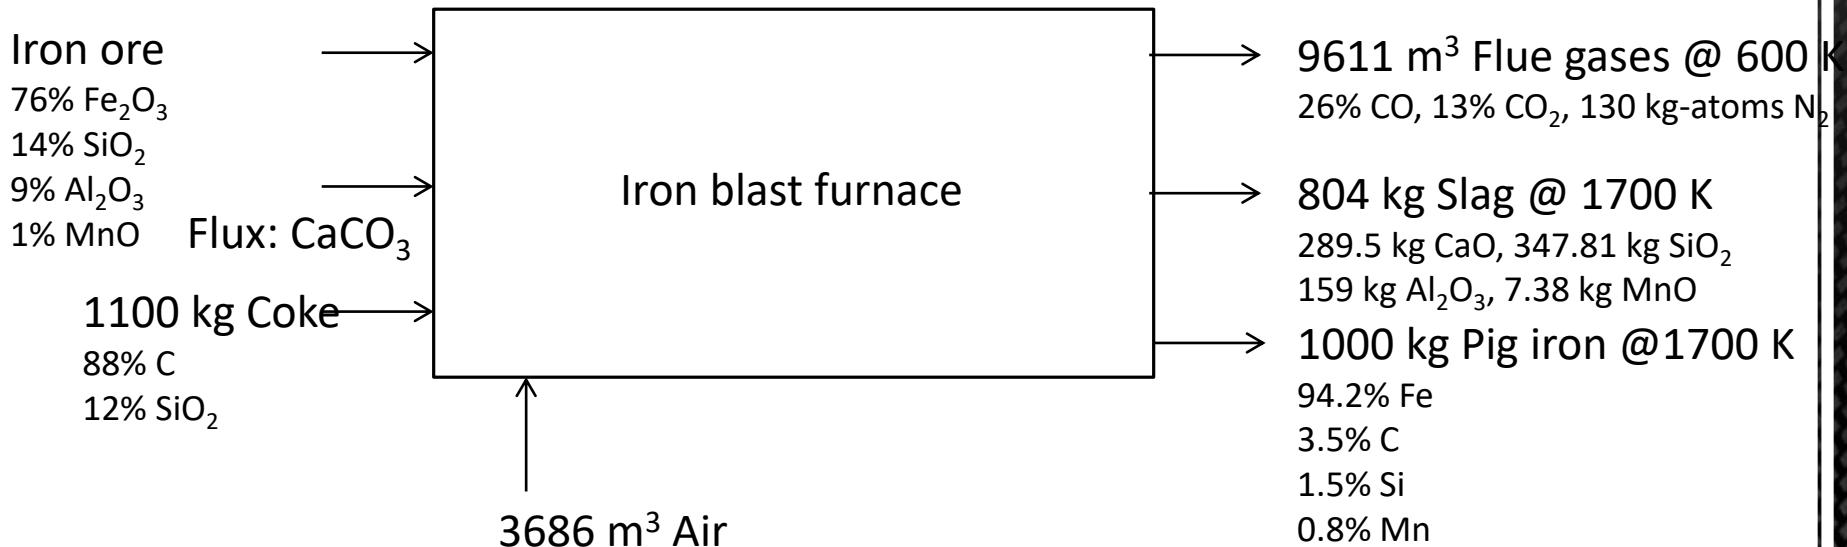

Reactions: $\text{CaCO}_3 = \text{CaO} + \text{CO}_2$, $\text{C} + \frac{1}{2} \text{O}_2 = \text{CO}$, $\text{Fe}_2\text{O}_3 + 3\text{CO} = 2\text{Fe} + 3\text{CO}_2$, $\text{SiO}_2 + 2\text{CO} = \text{Si} + 2\text{CO}_2$
 Basis 1000 kg Pig iron

Heat balance

Iron Smelting Analysis

Reactions: $\text{CaCO}_3 = \text{CaO} + \text{CO}_2$, $\text{C} + \frac{1}{2} \text{O}_2 = \text{CO}$, $\text{Fe}_2\text{O}_3 + 3\text{CO} = 2\text{Fe} + 3\text{CO}_2$, $\text{SiO}_2 + 2\text{CO} = \text{Si} + 2\text{CO}_2$

Basis 1000 kg Pig iron

Heat balance

Exothermic reactions

C in coke = 81 kg-atoms

Heat of formation of 81 kg-moles CO = $-26400 * 81 = 2138400 \text{ kcal}$

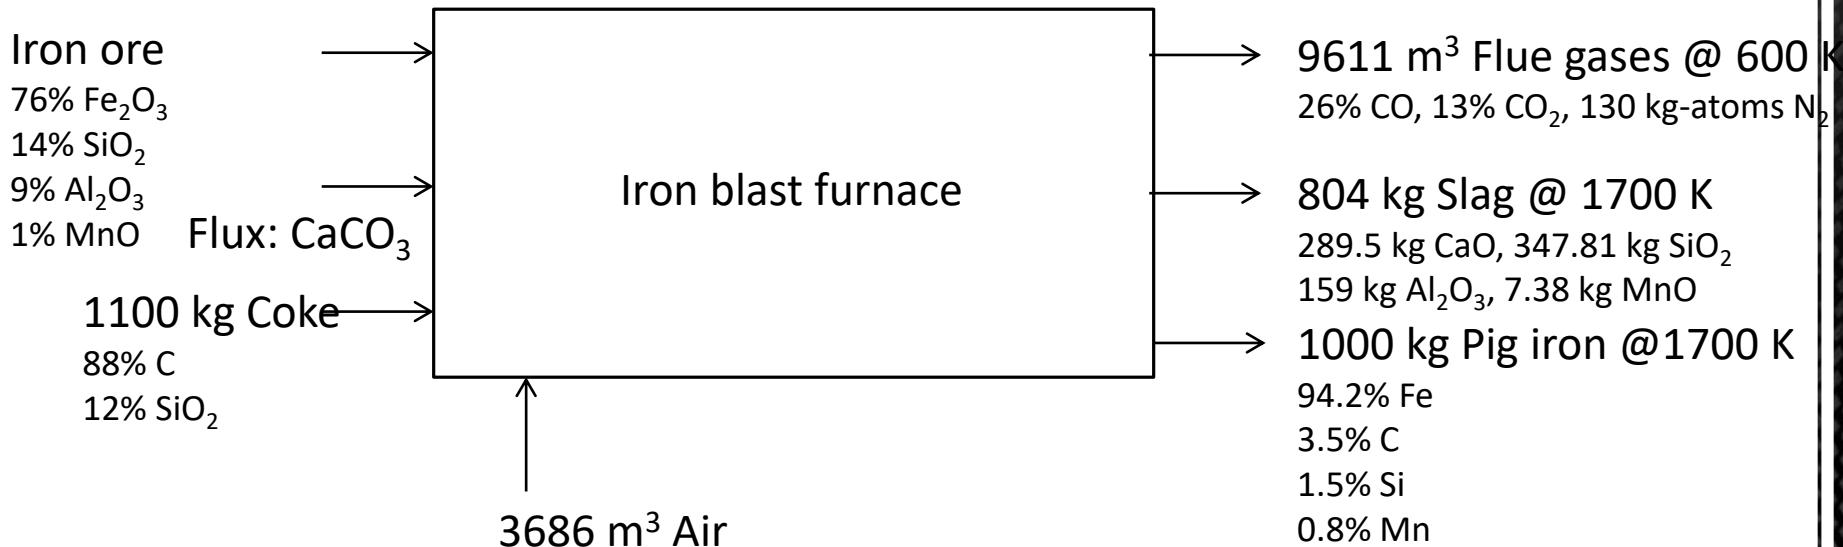

Endothermic reactions

CaO in slag = $289.5 / 56 = 5.17 \text{ kg-moles}$

Heat of decomposition of 5.17 kg-moles $\text{CaCO}_3 = 42500 * 5.17 = 219725 \text{ kcal}$

Iron Smelting Analysis

Endothermic reactions

$$\text{Fe}_2\text{O}_3 \text{ in ore} = 1771 * (76/100) = 1346 \text{ kg} = 8.41 \text{ kg-moles}$$

$$\text{Heat of reduction of } 8.41 \text{ kg-moles } \text{Fe}_2\text{O}_3 = 117273 * 8.41 = 986266 \text{ kcal}$$

$$\text{Si in pig iron} = 15 \text{ kg} = 0.54 \text{ kg-atoms}$$

$$\text{Heat of reduction of } 0.54 \text{ kg-moles } \text{SiO}_2 = 152600 * 0.54 = 79400 \text{ kcal}$$

$$\begin{aligned} \text{CO}_2 \text{ reduced} &= \text{CO}_2 \text{ produced} - \text{CO}_2 \text{ in flue gases} \\ &= 5.17 + 25.23 + 1.08 - 27.7 = 3.78 \text{ kg-moles} \end{aligned}$$

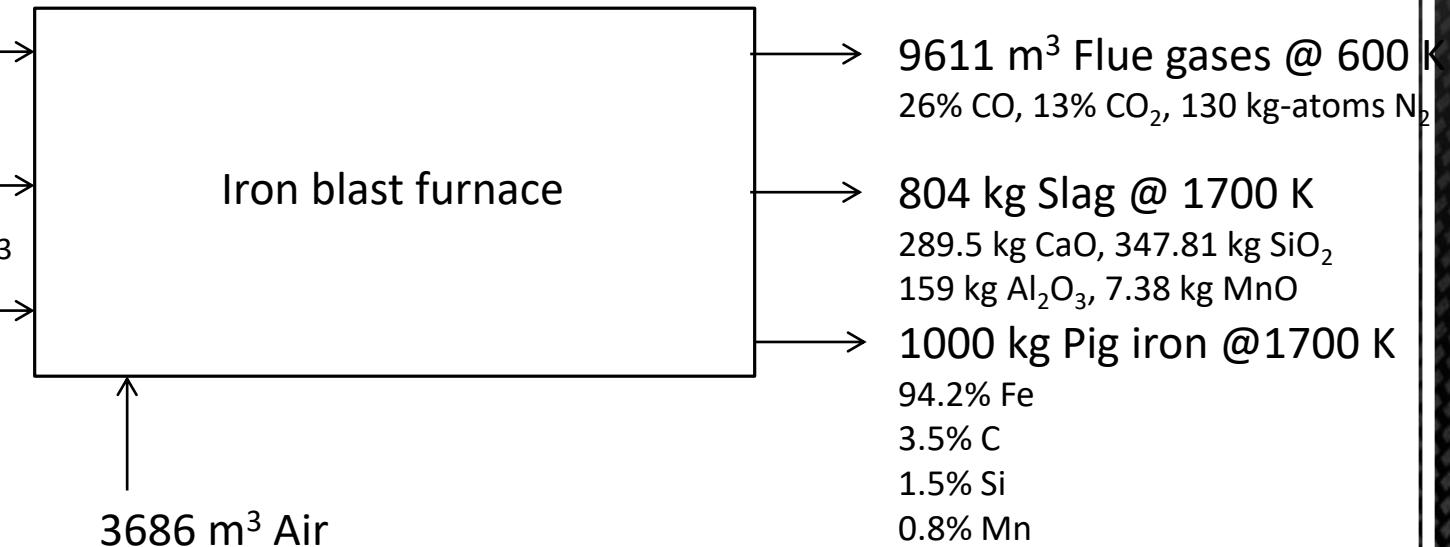

$$\text{Heat of reduction of } 3.78 \text{ kg-moles } \text{CO}_2 = 41600 * 3.78 = 157248 \text{ kcal}$$

Iron Smelting Analysis

Iron ore
76% Fe_2O_3
14% SiO_2
9% Al_2O_3
1% MnO

Flux: CaCO_3

1100 kg Coke
88% C
12% SiO_2

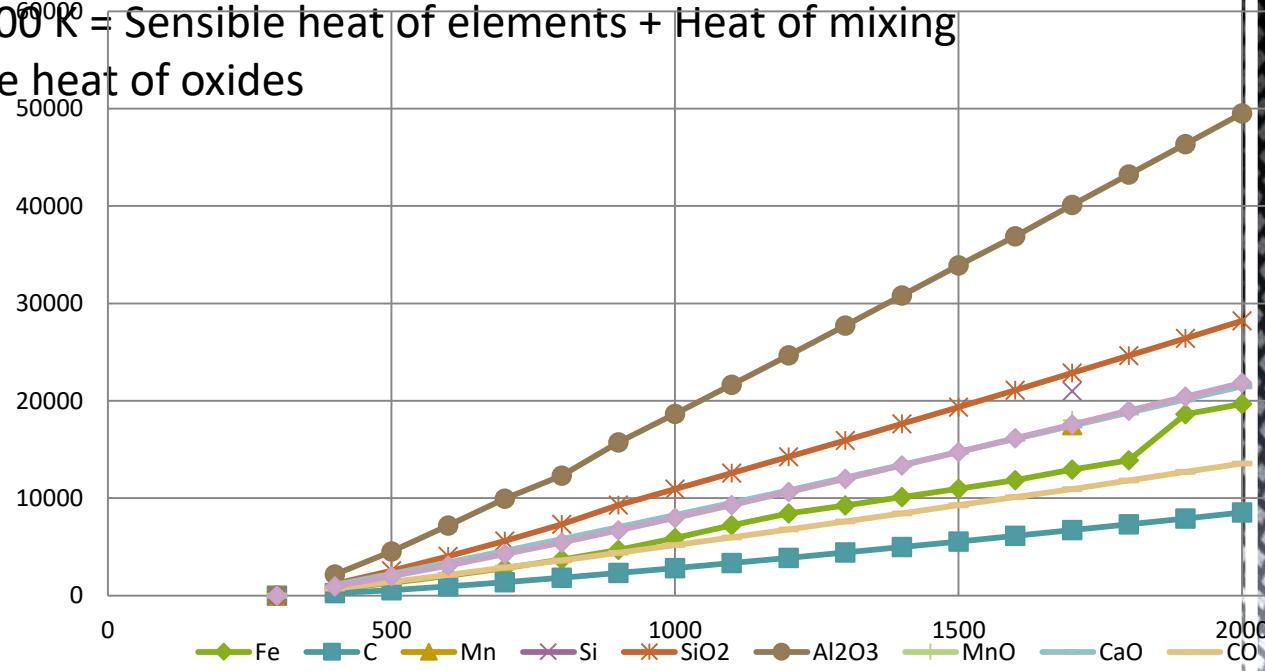

Heat outputs

Heat content of pig iron at 1700 K = Sensible heat of elements + Heat of mixing

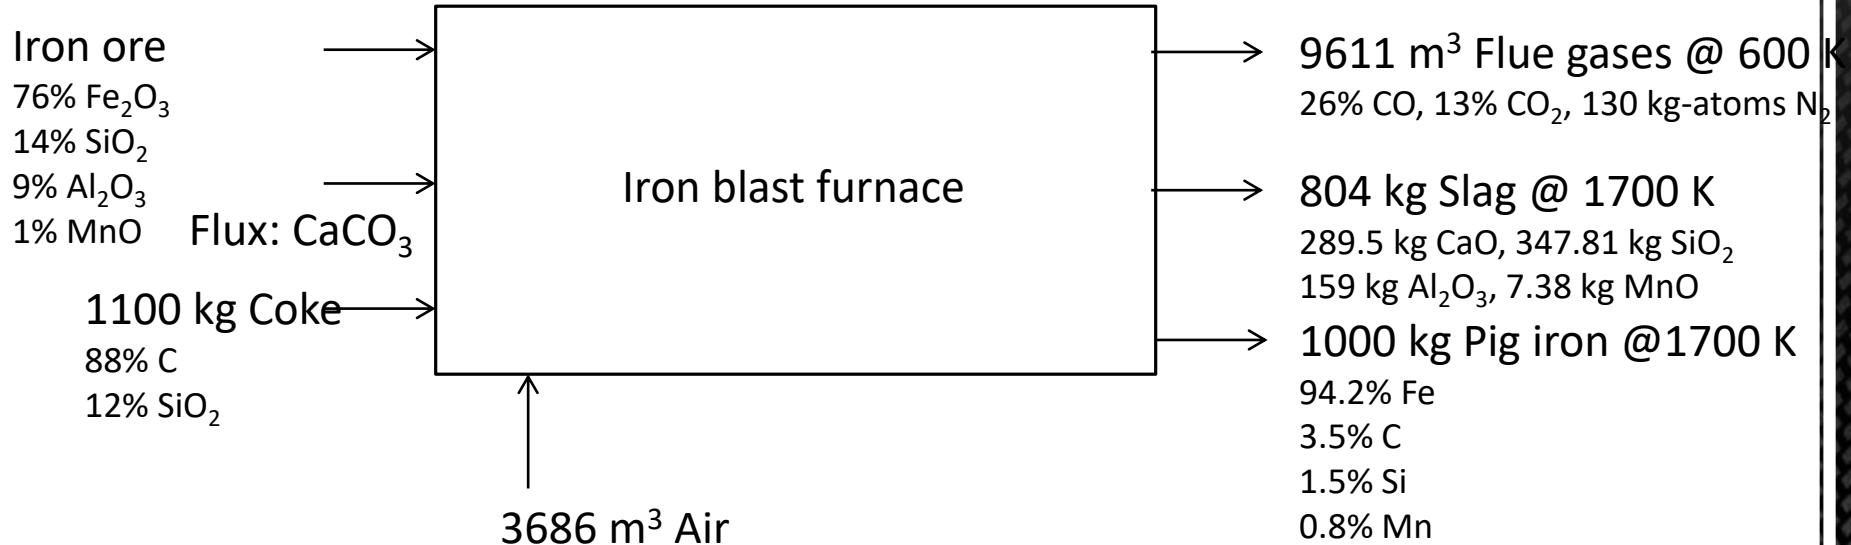

Heat content of slag = Sensible heat of oxides

Sensible heat in flue gases

Pig iron $\Delta H_m = 7500 \text{ kcal/ton}$
